Preliminary Decision of The Submitted Paper to ISITIA 2015

From: ISITIA 2015 Comittee (isitia2015@gmail.com)

To: am9520012003@yahoo.com

Date: Tuesday, 31 March 2015 at 10:12 pm GMT+7

Dear Authors,

Hereby, after reviewing the submitted papers to ISITIA 2015, we would like cordially to inform you that our preliminary decision for the submitted papers have been announced at our conference web site (<http://isitia.its.ac.id>). For detail information of the decision, you can access the information by logging in to our system with your account (<http://isitia.its.ac.id/base/login.php>)

Please consider the recommendations related to your submitted paper for further steps within the duration given for your submission.

Best Regards, Dr. Ronny Mardiyanto, ST, MT Chairman of ISITIA 2015 <http://isitia.its.ac.id>

ISITIA Friendly Reminder for Revised Paper Submission

From: ISITIA 2015 Comittee (isitia2015@gmail.com)

To: am9520012003@yahoo.com

Date: Monday, 6 April 2015 at 10:09 am GMT+7

Dear Authors,

Refering to our announcement of paper acceptance notification, we would like to congratulate you that your paper is conditionally accepted in our conference. In order for your paper to be fully accepted in our conference, we encourage you to revise your paper based on the reviewer comments. Detail informations on the revision and comments, you can access ISITIA website with your account.

If your revised paper has been submitted through ISITIA website, please ignore this reminder.

Thank you for your attention. We are looking forward to receiving your revised paper.

Best Regards, Dr. Ronny Mardiyanto Chairman of ISITIA 2015. <http://isitia.its.ac.id>

Final Decision of The Submitted Paper to ISITIA 2015

From: ISITIA 2015 Comittee (isitia2015@gmail.com)

To: am9520012003@yahoo.com

Date: Tuesday, 14 April 2015 at 10:01 am GMT+7

Dear Amirullah -,

The Technical Program Committee of the ISITIA 2015 has completed the evaluation on the following paper submission:

ID : 589

Title : Effect of Installation of Photovoltaic (PV) Generation to Power Quality in Industrial and Residential Customers Distribution Network

On behalf of the committee, I am pleased to inform you that the paper mentioned above has successfully implemented the reviewer comments to your paper and therefore the paper are accepted and will be considered for the presentation at The 2015 International Seminar on Intelligent Technology and Its Applications (ISITIA 2015). The session title and time of presentation will appear in the conference program, that will be available on the ISITIA 2015 website <http://isitia.its.ac.id>

At least one of the authors listed in your paper must pay a non-refundable registration fee by the early-bird deadline of April 17, 2015 in order that the paper be scheduled for presentation. Each registrant is allowed to claim more than one submission with an applicable discount of normal registration fee for the other paper submissions. After the early-bird deadline, all unclaimed papers will be deleted from the program. Register can be conducted via your ISITIA Account.

During the registration process you will be given the opportunity to request a "visa assistance" letter which can help you to obtain a visa to enter Indonesia. Once you have finished the registration process, a "visa assistance" letter will automatically be mailed to you, together with the confirmation of your registration.

We can only issue these "visa invitation" letters after completion of your registration.

Should you need further assistance on the "visa invitation", please do not hesitate to contact us via sitia@its.ac.id.

Congratulations on your successful submission! We look forward to seeing you at Surabaya.

Best Regards, Dr. Ronny Mardiyanto, ST, MT Chairman of ISITIA 2015 <http://isitia.its.ac.id>

Nominal (IDR) payment for PhD Student Author Participant in Isitia 2015

Dear Isitia 2015 Commitee,

I am Amirullah, my paper title below accepted to present in Isitia 2015 conference on May 20, 2015. My status is Doctorate (S3) Student in Electrical Engineering ITS Surabaya (Power System) and lecturer in same department at University Bhayangkara Surabaya. Next I would process the payment of registration fee. Depend on the guideline in Isitia 2015 website I have to pay IDR 950.000 and IDR 200.000, for hardcopy or book - (total IDR 1.150.000) related with my status as PhD student in ITS Surabaya based time limit on April 17, 2015.

Is the nominal (IDR) payment corrent? If yes I would like to pay the registration fee today.

This is my question and thanks a lots for your anwer.

Dear Mr. Amirullah,

Thank you for your email.

Regarding the registration fee of your paper, please proceed the registration related to your student status. Please also show your Student ID as a proof of your status.

Thank you and see you in the conference.

Regards,
Technical Committee.

Dear Dr. Ronny Mardiyanto,

Today I already have paid registration and order of hardcopy proceeding fees of Isitia 2015 as PhD ITS student (IDR 950.000 + IDR 200.000 = IDR 1.150.000), follow some steps of registration process (upload proof of payment and student ID), and finally click submit toolbox.

But in that registration process menu, there is no proof or validation to make sure what Isitia 2015 oral presenter or another participant has finished or submitted this process.

How could I know that I have finished or submitted of Isitia 2015 registration (number 9 process).

This is my answer and thank you very much for your respon.

Abstract-Objective of research is to analyze the influence of the photovoltaic (PV) generator installation to power quality on distribution network. There are two models of load distribution network, namely industrial and residential costumers distribution network. Simulation results show that the value of bus voltage THD on distribution network of industrial and residential customers are still under of voltage THD limit recomended by IEEE 519-1992 equal as 5%. The majority of the value of TDD conductor in two models of the distribution network is under the limit conductor current TDD recommended by IEEE 519-1992. In network industries and residential customers, the more number of PV plants installed, then the value of current harmonics (TDD) at PCC bus will be even greater. The using of single tuned passive filter able to improve THD Bus and TDD conductor still does not meet the standart requirements.

Keywords: *Photovoltaic Generator, Harmonics, Total Harmonic Distortion, Total Demand Distortion*

I. INTRODUCTION

Utility customers are becoming more and more demanding in energy consumption and they need good supply to operate reliably. At the same time they tend to disrupt the utility supply with the equipment used for their main daily activities. Such kind of equipment may include variable speed drives, computers, electronic ballasts, and power electronic devices. This is imposing of higher burden on utilities to supply good quality electrical energy. Consequently, renewable energy sources and distributed generator (DG) will play a significant role in the energy mix in the future and a number of further research is require to optimize the number of grid development strategies and improve of power quality [1]. Microgrid is a group of loads and generators that operate as a controlled system that provides electricity to a particular region with relatively limited power. The concept provides a new view to define the operation of distributed generator [2], [3]. In microgrid technology, which is commonly used plant is a plant with renewable energy sources. One source of renewable energy is photovoltaic (PV) generator. The use of PV as an energy source requires an inverter to convert DC into AC voltage. In addition to function as a kind of change of voltage, inverter also cause damage to existing fundamental wave and commonly called harmonics. If it can not be controlled, then the harmonics will cause damage to equipment such as transformers, cables, and

other electrical devices. One way to reduce the harmonics is using a filter [4].

The purpose of research is to analyze the influence of the photovoltaic (PV) generator installation to power quality on distribution network. There are two models of load distribution network, namely industrial and residential costumers distribution network. The research method begins by determining network modeling is connected to PV system, PV array circuit model, PV inverter circuit topology model, and network topology model of industrial and residential costumers. The next step is to determine a mathematical model of current control circuit PV inverter. The next process is to determine the strategy of the PV generator installation in the distribution network of industrial and residential customers. The next stage is to determine the value of bus voltage THD, conductor current TDD, and conductor power factor in the distribution network of industrial and residential customers on a different strategies PV generator installation. Futhermore is comparing value of bus voltage THD and conductor current TDD refers to IEEE Standard 519-1992 and conductor power factor refers on to the standard Indonesian Electricity Company (PLN) as a basis for determining level of power quality in industrial and residential customer distribution network. Single tuned passive filter are selected to improve THD bus and TDD conductor value still does not meet the standart requirements.

II. THEORY

A. Power Quality Standart

Power quality has become a major concern in electrical world for recent decades. One issue that arises is the emergence of the current and voltage waveform is not sinusoidal or defects caused by the emergence of harmonics generated by the power system [5]. Figure 1 shows distorted waveform signal due to harmonics.

Figure 1. Distorted Wave Cause Harmonics. Where: a = Fundamental Frequency Wave, b.1 = 3rd Harmonics Wave, b.2 = 5th Harmonics Wave, c. = Distorted Harmonics.

The first parameter is the Total Harmonic Distortion (THD). THD is the ratio of the rms value of the harmonic components to rms value of fundamental component and is commonly expressed in percent (%). This index is used to measure periodic waveform deviations contains harmonics of a perfect sine wave [6]. In a perfect sine wave THD value is zero percent. THD value is expressed in Equation 1 as follows:

$$THD = \frac{\sqrt{\sum_{n=2}^k U_n^2}}{U_1} \times 100 \% \quad (1)$$

Where: U_n = Harmonic Component; U_1 = Fundamental Component; K = Maximum Harmonic Component

The second parameter is Individual Harmonic Distortion (IHD) is ratio of the rms value of individual harmonics to the rms value of fundamental component. The third parameter is Total Demand Distortion (TDD) is amount of current harmonic distortion and defined in the following Equation 2 [7]:

$$TDD = \frac{\sqrt{\sum_{n=2}^k I_n^2}}{I_L} \times 100 \% \quad (2)$$

Where I_L is maximum load current (for 15 or 30 minutes) at fundamental frequency at the Point of Common Coupling (PCC), is calculated from current average of maximum load of 12 months before.

Maximum THD value which allowable for each country is different depending on the standard used. THD standards is most often used in the electric power system is the IEEE Standard 519-1992. There are two criteria that are used in the analysis of harmonic distortion is the limit voltage distortion and current distortion limits. Table I shows voltage distortion limit (THD) on power distribution system. Table II shows current distortion limit is based on the IEEE Standard 519-1992 [5].

B. Single Tuned Shunt Passive Filter

Shunt passive filters always considered as a good solution to solve harmonic current problems [8], shunt passive filters can be classified into three basic categories as follows:

1. Band pass filters (of single or double tuned).
2. High pass filters (of first, second, third-order or C-type).
3. Composite filters as shown in figure 4.

The single tuned filter (Figure 2) consisting of inductor L_f , capacitor C_f and small damping resistor R_f are connected in parallel with non linear loads to provide low-impedance paths for specific harmonic frequencies, thus resulting in absorbing the dominant harmonic currents flowing out of the load. Furthermore it also compensates reactive power at system operating frequency.

Figure 2. Single Tuned Shunt Passive Filter

The impedance versus frequency of this filter is shown [9]:

$$Z_f(S) = \frac{1 + R_f C_f S + L_f C_f S^2}{C_f S} \quad (3)$$

Where $S = j2\pi f$

Generally the filter capacitor is sized for known reactive power compensation Q_c required to improve power factor, C_f can be expressed as:

$$C_f = \frac{1}{2\pi f_1 U^2} \left(1 - \frac{1}{n^2} \right) \quad (4)$$

Where U is the supply voltage, n is the harmonic order and f_1 is a fundamental frequency.

At the harmonic frequency $f_n = n f_1$ the filter reactor provides a series resonance.

$$L_f 2\pi f_n = \frac{1}{C_f 2\pi f_n} \quad (5)$$

The inductive value of filter can be obtained from equation 6 as:

$$L_f = \frac{1}{(2\pi f_n)^2 C_f} \quad (6)$$

The value of the low-impedance R_f for each single tuned filter is affected by the quality factor of filter Q .

$$R_f = 2\pi f_1 n \frac{L_f}{Q} \quad (7)$$

The quality factor Q determines the sharpness of tuning. Usually, a value of Q ranges between 20 and 100. High Q -value filter give the best reduction in harmonic distortion. The interaction of the filter with the source reactance L_s , creates a parallel resonance condition addition to the series resonance frequency of the filter.

$$f_p = \frac{1}{2\pi \sqrt{(L_f + L_s) C_f}} \quad (8)$$

C. Photovoltaic System

Photovoltaic systems (PV) or solar panels is one of renewable energy power generator that utilize sun as main source and then converted into electrical energy. In general, solar power has to be accepted as an alternative energy source. The issue now is the price is still expensive compared to electricity generated by other energy sources, so its use is now limited to a limited scale such as in electrical devices and are also used as power generator in areas that are still inaccessible by electrical network [10]. Figure 3 shows PV characteristic curve.

METHODOLOGY

A. Research Method

Research method begins by determining network model (grid) is connected to the PV system, PV array circuit model, PV inverter circuit topology models, as well as the distribution network topology model of industrial and residential customers. The next step is to determine a mathematical model of current control circuit of PV inverter. The next process is to determine the strategy of PV power generator installation in the distribution network of industrial and residential customers. PV system model which has been subsequently simulated in two distribution network topology. The first network representing industrial area measurements made before and after the installation of 150 kW PV system and the residential area. In the industrial customer case studies, three 150 kW PV system connected to the distribution network and subsequent evaluation of response of distribution network. A residential customer distribution topology then proposed with a 150 kW PV system. The next stage is to determine value of bus voltage THD, current TDD, and power factor (power factor) conductor in the distribution network of industrial and residential customers on a number of strategies installation of PV generator. Furthermore, comparing value of bus voltage THD and current conductor TDD refers to IEEE Standard 519-1992 and conductor power factor refers to the standard PLN. Single tuned passive filters are installed to improve THD bus and TDD conductor value still does not meet the standart

requirements. Simulation and analysis of research using ETAP 7.0 software.

B. PV Model Description

The PV system model proposed for the simulation consists of PV array, diode, inverters and a power grid interface as shown in Figure 4. The PV array is modeled according to its equivalent circuit shown in Figure 5, by using the equation deriving from aforementioned circuit representation.

Figure 4. Proposed model for grid-connected photovoltaic system

In particular, the behavior of the PV array model is affected by the solar irradiance, the temperature and the specific characteristics of the chosen PV module technology. The PV inverter circuit is composed of a DC to DC converters which is necessary to determine maximum power point tracking of PV arrays, a DC to AC converter to transform DC power into AC, means of energy transfer to absorb fast voltage variations and filters to eliminate undesirable harmonic components. The modular circuit of the PV inverter is shown in Figure 6.

Figure 5. Equivalent circuit of PV array

A maximum power point tracking mechanism to extract the maximum power available from the PV array is also considered. The maximum power point tracking adopted is the incremental conductance method with integral regulator to minimize the errors in tracking MPP. More information about the specific algorithm is found in reference [1]. Distribution network model of industrial and residential customers is shown in Figure 6 and 7.

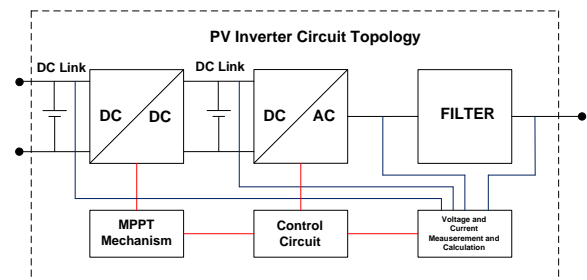

Figure 6. PV inverter circuit topology

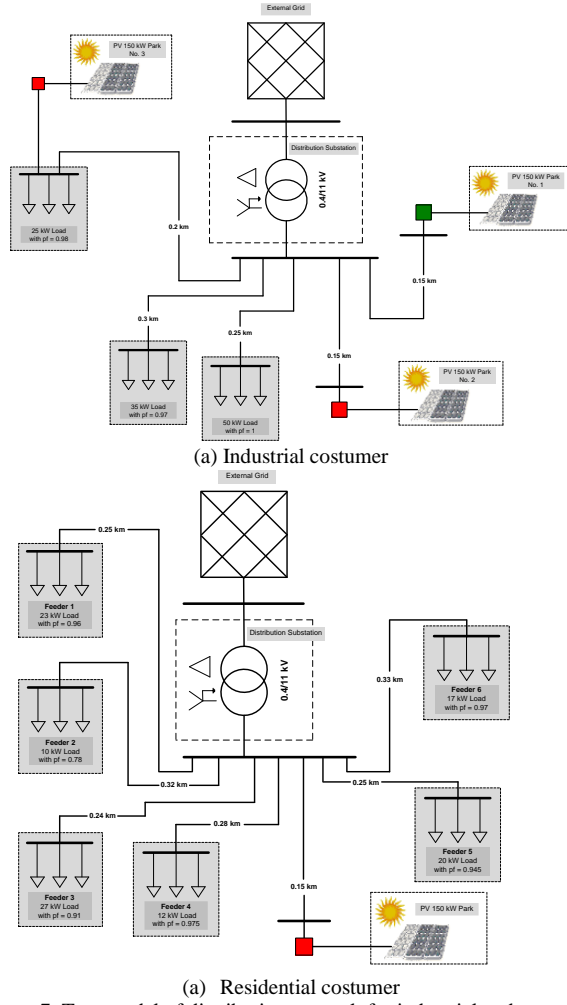

Figure 7. Two model of distribution network for industrial and residential customer

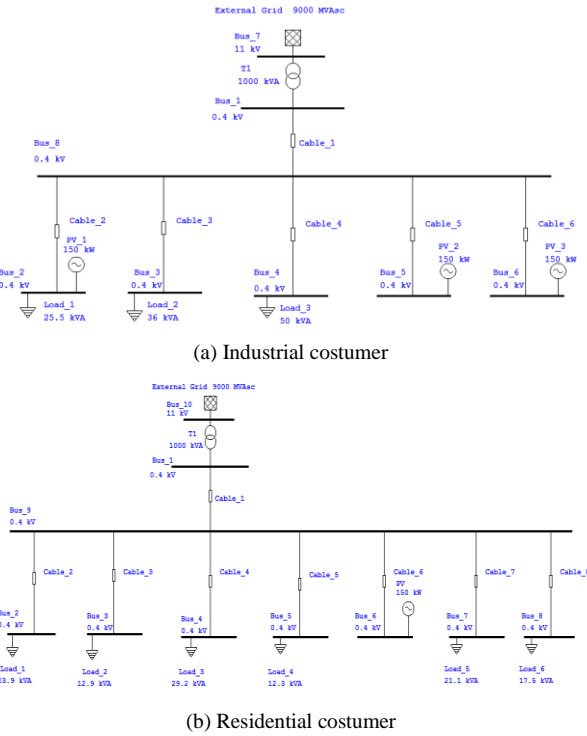

Figure 8. Two model of distribution network for industrial and residential customer using ETAP

RESULT AND DISCUSSION

Research was conducted on the condition of system is connected to microgrid. There are two models of network topology, namely distribution network of industrial and residential customers. Both grid distribution network supplied by a power transformer 1000 kVA, 11/0.4 kV Δ/Y connection, which is connected to the external grid MVA_{sc} 9000. The first distribution network connected to 5 buses, respectively 2 load buses, connected to the PV plant, as well as one other bus connected to the PV generator and also serves as a bus load. The second distribution networks connected to 7 buses, each 6 load buses and 1 bus is connected to PV generator. Data load, transformer, conductor, and PV generator on the distribution network of industrial and residential customer are shown in Table III. PV generator in addition to functioning supplying power to the distribution network, is also a source of harmonics due to the presence of inverter as a medium to transform the DC voltage into AC voltage. Data of harmonic current generated by the PV generator is shown in Table IV [10]. Harmonic order are generated according to the ability of ETAP 7.0 software.

TABLE IV. HARMONIC CURRENT GENERATE BY PV

Order	Mag (%)	Order	Mag (%)
2	0.71	11	0.24
3	1.85	12	0.08
4	0.57	13	0.16
5	0.52	14	0.25

	3	0.988	0.13	5
	4	0.987	0.13	5
	5	0.998	0.13	5
	6	0.990	0.17	5
	7	0.987	0.13	5
	8	0.987	0.13	5
	9	0.989	0.13	5
	10	1.000	0.00	5

Table V dan VI shows that bus voltage THD value on distribution network of industrial and residential customers ranged between 0 through 0.45%. This value is still below limit of voltage THD recommended by IEEE 519-1992 by 5%. The addition of PV generator in both distribution network generates increasing of voltage THD value. On industrial customer network without PV, maximum bus voltage THD value is 0.01%, while network using three PV maximum bus voltage THD value increased to 0.45%. The maximum bus voltage THD value on residential customer networks without PV of 0.02% and if using PV maximum bus voltage THD value increased to 0.17%.

Figure 8 and 9 show that on industrial and residential customers network, the more the number of PV generator installed then value of current harmonics (TDD) at PCC bus will be even greater. This is because in addition to functioning PV generator supplying power to the distribution network, is also generating harmonics due to presence of inverter as a media to convert DC to AC voltage.

Table VI shows that the value of conductor currents TDD in the industrial customers distribution network ranging from 0 through 224.9%. The value of conductor currents TDD in the residential distribution network ranges between 0 trough 39.44%. The majority

of the value of TDD channel in two models of the distribution network is under the limit conductor currents TDD recommended by IEEE 519-1992. The addition of PV generator in two models distribution network produce conductor current TDD value is increasing. The most value of conductor current TDD average generated by conductor that is connected directly to the PV generator bus. The value of the power factor in the distribution network of industrial and residential customers on average already meet the minimum requirements PLN limit by 85%, except for the bus that is not connected to the PV generator.

CONCLUSION

The simulation results show that the THD value on the bus voltage distribution network of industrial and residential customers are still under voltage THD limit recommended by the IEEE 519-1992 by 5%. The majority of the value of TDD conductor in two models of the distribution network is under the limit conductor current TDD recommended by IEEE 519-1992. In industrial and residential customer networks, the more the number of PV generator installed, then the value of current TDD at PCC bus will be even greater. This is because in addition to functioning PV plants supplying power to the distribution network, is also generates harmonics due to the presence of the inverter as a medium to transform DC into AC voltage. The value of power factor in the distribution network of industrial and residential customers on average already meet minimum requirements set PLN limits by 85%.

Abstract-Objective of research is to analyze the influence of the photovoltaic (PV) generator installation to power quality on distribution network. There are two models of load distribution network, namely industrial and residential costumers distribution network. Reseach show that the value of bus voltage THD on distribution network of industrial and residential customers are still under of voltage THD limit recomended by IEEE 519-1992 equal as 5%. The majority of the value of TDD conductor in two models of the distribution network is under the limit conductor current TDD recommended by IEEE 519-1992. In network industries and residential customers, the more number of PV plants installed, then the value of current harmonic (TDD) at PCC bus will be even greater. The most value of conductor current TDD average generated by conductor that is connected directly to the PV generator bus The using of single tuned passive filter able to improve THD Bus and TDD conductor which still does not meet the standart requirements.

I. INTRODUCTION

Utility customers are becoming more and more demanding in energy consumption and they need good supply to operate reliably. At the same time they tend to disrupt the utility supply with the equipment used for their main daily activities. Such kind of equipment may include variable speed drives, computers, electronic ballasts, and power electronic devices. This is imposing of higher burden on utilities to supply good quality electrical energy. Consequently, renewable energy sources and distributed generator (DG) will play a significant role in the energy mix in the future and a number of further research is require to optimize the number of grid development strategies and improve of power quality [1]. Microgrid is a group of loads and generators that operate as a controlled system that provides electricity to a particular region with relatively limited power. The concept provides a new view to define the operation of distributed generator [2], [3]. In microgrid technology, which is commonly used plant is a plant with renewable energy sources. One source of renewable energy is photovoltaic (PV) generator. The use of PV as an energy source requires an inverter to convert DC into AC

voltage. In addition to function as a kind of change of voltage, inverter also cause damage to existing fundamental wave and commonly called harmonics. If it can not be controlled, then the harmonics will cause damage to equipment such as transformers, cables, and other electrical devices. One way to reduce the harmonics is using a filter [4].

The purpose of research is to analyze the influence of the photovoltaic (PV) generator installation to power quality on distribution network. There are two models of load distribution network, namely industrial and residential costumers distribution network. The research method begins by determining network modeling is connected to PV system, PV array circuit model, PV inverter circuit topology model, and network topology model of industrial and residential costumers. The next step is to determine a mathematical model of current control circuit PV inverter. The next process is to determine the strategy of the PV generator installation in the distribution network of industrial and residential customers. The next stage is to determine the value of bus voltage THD, conductor current TDD, and conductor power factor in the distribution network of industrial and residential customers on a different strategies PV generator installation. Furthermore is comparing value of bus voltage THD and conductor current TDD refers to IEEE Standard 519-1992 and conductor power factor refers on to the standard Indonesian Electricity Company (PLN) as a basis for determining level of power quality in industrial and residential customer distribution network. Single tuned passive filter are selected to improve THD bus and TDD conductor value which still does not meet the standart requirements.

II. THEORY

A. Power Quality Standart

Power quality has become a major concern in electrical world for recent decades. One issue that arises is the emergence of the current and voltage waveform is not sinusoidal or defects caused by the emergence of harmonics generated by the power system [5]. Figure 1 shows distorted waveform signal due to harmonics.

Figure 1. Distorted Wave Cause Harmonics. Where: a = Fundamental Frequency Wave, b.1 = 3rd Harmonics Wave, b.2 = 5th Harmonics Wave, c. = Distorted Harmonics.

The first parameter is the Total Harmonic Distortion (THD). THD is the ratio of the rms value of the harmonic components to rms value of fundamental component and is commonly expressed in percent (%). This index is used to measure periodic waveform deviations contains harmonics of a perfect sine wave [6]. In a perfect sine wave THD value is zero percent. THD value is expressed in Equation 1 as follows:

$$THD = \frac{\sqrt{\sum_{n=2}^k U_n^2}}{U_1} \times 100 \% \quad (1)$$

Where: U_n = Harmonic Component; U_1 = Fundamental Component; K = Maximum Harmonic Component

The second parameter is Individual Harmonic Distortion (IHD) is ratio of the rms value of individual harmonics to the rms value of fundamental component. The third parameter is Total Demand Distortion (TDD) is amount of current harmonic distortion and defined in the following Equation 2 [7]:

$$TDD = \frac{\sqrt{\sum_{n=2}^k I_n^2}}{I_L} \times 100 \% \quad (2)$$

Where I_L is maximum load current (for 15 or 30 minutes) at fundamental frequency at the Point of Common Coupling (PCC), is calculated from current average of maximum load of 12 months before.

Maximum THD value which allowable for each country is different depending on the standard used. THD standards is most often used in the electric power system is the IEEE Standard 519-1992. There are two criteria that are used in the analysis of harmonic distortion is the limit voltage distortion and current distortion limits. Table I shows voltage distortion limit (THD) on power distribution system. Table II shows current distortion limit is based on the IEEE Standard 519-1992 [5].

B. Single Tuned Shunt Passive Filter

Shunt passive filters always considered as a good solution to solve harmonic current problems [8], shunt passive filters can be classified into three basic categories as follows:

1. Band pass filters (of single or double tuned).
2. High pass filters (of first, second, third-order or C-type).
3. Composite filters.

The single tuned filter (Figure 2) consisting of inductor L_f , capacitor C_f and small damping resistor R_f are connected in parallel with non linear loads to provide low-impedance paths for specific harmonic frequencies, thus resulting in absorbing the dominant harmonic currents flowing out of the load. Furthermore it also compensates reactive power at system operating frequency.

Figure 2. Single Tuned Shunt Passive Filter

The impedance versus frequency of this filter is shown [9]:

$$Z_f(S) = \frac{1 + R_f C_f S + L_f C_f S^2}{C_f S} \quad (3)$$

Where $S = j2\pi f$

Generally the filter capacitor is sized for known reactive power compensation Q_c required to improve power factor, C_f can be expressed as:

$$C_f = \frac{1}{2\pi f_1 U^2} \left(1 - \frac{1}{n^2} \right) \quad (4)$$

Where U is the supply voltage, n is the harmonic order and f_1 is a fundamental frequency.

At the harmonic frequency $f_n = n f_1$ the filter reactor provides a series resonance.

$$L_f 2\pi f_n = \frac{1}{C_f 2\pi f_n} \quad (5)$$

The inductive value of filter can be obtained from equation 6 as:

$$L_f = \frac{1}{(2\pi f_n)^2 C_f} \quad (6)$$

The value of the low-impedance R_f for each single tuned filter is affected by the quality factor of filter Q .

$$R_f = 2\pi f_1 n \frac{L_f}{Q} \quad (7)$$

The quality factor Q determines the sharpness of tuning. Usually, a value of Q ranges between 20 and 100. High Q -value filter give the best reduction in harmonic distortion. The interaction of the filter with the source reactance L_s , creates a parallel resonance condition addition to the series resonance frequency of the filter.

$$f_p = \frac{1}{2\pi(\sqrt{L_f + L_s})C_f} \quad (8)$$

C. Photovoltaic System

Photovoltaic systems (PV) or solar panels is one of renewable energy power generator that utilize sun as main source and then converted into electrical energy. In general, solar power has to be accepted as an alternative energy source. The issue now is the price is still

expensive compared to electricity generated by other energy sources, so its use is now limited to a limited scale such as in electrical devices and are also used as power generator in areas that are still inaccessible by electrical network [10]. Figure 3 shows PV characteristic curve.

III. METHODOLOGY

A. Research Method

Research method begins by determining network model (grid) is connected to the PV system, PV array circuit model, PV inverter circuit topology models, as well as the distribution network topology model of industrial and residential customers. The next step is to determine a mathematical model of current control circuit of PV inverter. The next process is to determine the strategy of PV power generator installation in the distribution network of industrial and residential customers. PV system model which has been subsequently simulated in two distribution network topology. The first network representing industrial area measurements made before and after the installation of 150 kW PV system and the residential area. In the industrial customer case studies, three 150 kW PV system connected to the distribution network and subsequent evaluation of response of distribution network. A residential customer distribution topology then proposed with a 150 kW PV system. The next stage is to determine value of bus voltage THD, current TDD, and power factor (power factor) conductor in the distribution network of industrial and residential customers on a number of strategies installation of PV generator. Furthermore,

comparing value of bus voltage THD and current conductor TDD refers to IEEE Standard 519-1992 and conductor power factor refers to the standard PLN. Single tuned passive filters are installed to improve THD bus and TDD conductor value still does not meet the standart requirements. Simulation and analysis of research using ETAP 7.0 software.

B. PV Model Description

The PV system model proposed for the simulation consists of PV array, diode, inverters and a power grid interface as shown in Figure 4. The PV array is modeled according to its equivalent circuit shown in Figure 5, by using the equation deriving from aforementioned circuit representation.

Figure 4. Proposed model for grid-connected photovoltaic system

In particular, the behavior of the PV array model is affected by the solar irradiance, the temperature and the specific characteristics of the chosen PV module technology. The PV inverter circuit is composed of a DC to DC converters which is necessary to determine maximum power point tracking of PV arrays, a DC to AC converter to transform DC power into AC, means of energy transfer to absorb fast voltage variations and filters to eliminate undesirable harmonic components. The modular circuit of the PV inverter is shown in Figure 6.

Figure 5. Equivalent circuit of PV array

A maximum power point tracking mechanism to extract the maximum power available from the PV array is also considered. The maximum power point tracking adopted is the incremental conductance method with integral regulator to minimize the errors in tracking MPP. More information about the specific algorithm is found in reference [1]. Distribution network model of industrial and residential customers is shown in Figure 7 and 8.

Figure 8. Two model of distribution network for industrial and residential customer using ETAP

IV. RESULT AND DISCUSSION

Research was conducted on the condition of system is connected to microgrid. There are two models of network topology, namely distribution network of industrial and residential customers. Both grid distribution network supplied by a power transformer 1000 kVA, 11/0.4 kV Δ/Y connection, which is connected to the external grid MVA_{sc} 9000. The first distribution network connected to 5 buses, respectively 2 load buses, connected to the PV plant, as well as one other bus connected to the PV generator and also serves as a bus load. The second distribution networks connected to 7 buses, each 6 load buses and 1 bus is connected to PV generator. Data load, transformer, conductor, and PV generator on the distribution network of industrial and residential customer are shown in Table III. PV generator in addition to functioning supplying power to the distribution network, is also a source of harmonics due to the presence of inverter as a medium to transform the DC voltage into AC voltage. Data of harmonic current generated by the PV generator is shown in Table IV [11]. Harmonic order are generated according to the ability of ETAP 7.0 software.

TABLE IV. HARMONIC CURRENT GENERATE BY PV

Order	Mag (%)	Order	Mag (%)
2	0.71	11	0.24
3	1.85	12	0.08
4	0.57	13	0.16
5	0.52	14	0.25

Table V dan VI shows that bus voltage THD value on distribution network of industrial and residential customers ranged between 0 through 0.45%. This value is still below limit of voltage THD recommended by IEEE 519-1992 by 5%. The addition of PV generator in both distribution network generates increasing of voltage THD value. On industrial customer network without PV, maximum bus voltage THD value is 0.01%, while network using three PV maximum bus voltage THD value increased to 0.45%. The maximum bus voltage THD value on residential customer networks without PV of 0.02% and if using PV maximum bus voltage THD value increased to 0.17%.

Figure 9 and 10 show that on industrial and residential customers network, the more the number of PV generator installed then value of current harmonics (TDD) at PCC bus will be even greater. This is because in addition to functioning PV generator supplying power to the distribution network, is also generating harmonics due to presence of inverter as a media to convert DC to AC voltage.

Table VII shows that the value of conductor currents TDD in the industrial customers distribution network has already meet current TDD recommended by IEEE 519-1992 except on conductor 2, 5, and 6. Current TDD value on conductor 2 has a minimum because value of the

power factor is 1.0. Improvement of TDD current only can be done on conductor 5 and 6 for the condition of P1 + PV1 and PV1+ PV2 + PV3 connected to the grid by increasing power factor of both conductor becomes 1.0. By using the power triangular method, we will obtain reactive power compensation value to get value of C, L, and R is based on the most dominant-order harmonics with a single passive filters tuned using Equation 4 to 7. The most dominant-order harmonics are 3rd, 5th, 7th, 11th, and 14th. By using the same procedure, mitigation of current TDD can be done on conductor 6 in the residential distribution network for PV installed to the grid. Table VIII shows designed single tuned passive filters, current TDD without and with filter. From Table VII, we can see that nominal current TDD on conductor 5 and 6 in the industrial costumer distribution network before using single tuned passive filters are 224.9 and 39.4. After using 3rd order single tuned passive filter, as shown in Table VIII, the value of current TDD for both conductor has reduced to 154.68 and 28.26. Improvement of current TDD using filter also happens on conductor 6 in the residential distribution network for PV installed to the grid. Figure 11 and 12 show harmonic current spectrum of conductor 6 for PV1 + PV 2 + PV 3 connected to grid on industrial costumer network before and after installed single tuned passive filter.

Figure 11. Harmonic current spectrum of conductor 6 for PV1 + PV 2 + PV 3 connected to grid on industrial costumer network without filter

Figure 12. Harmonic current spectrum of conductor 6 for PV1 + PV 2 + PV 3 connected to grid on industrial costumer network with filter

Table VII also shows that the addition of PV generator in two models distribution network produce conductor current TDD value is increasing. The most value of conductor current TDD average generated by conductor that is connected directly to the PV generator bus.

V. CONCLUSION

The simulation results show that the THD value on the bus voltage distribution network of industrial and residential customers are still under voltage THD limit recommended by the IEEE 519-1992 by 5%. The majority of the value of TDD conductor in two models of the distribution network is under the limit conductor current TDD recommended by IEEE 519-1992. In industrial and residential customer networks, the more the

number of PV generator installed, then the value of current TDD at PCC bus will be even greater. This is because in addition to functioning PV plants supplying power to the distribution network, is also generates harmonics due to the presence of the inverter as a medium to transform DC into AC voltage. Using of single tuned passive filter 3rd order give better solution to improve current TDD. The value of power factor in the distribution network of industrial and residential customers on average already meet minimum requirements set PLN limits by 85%.

Committee ISITIA 2015

ISITIA Committee

General Chairman : Ronny Mardiyanto

Co-Chairman : Margo Pujiantara

Organizing Committee:

Prasetiyono Hari Mukti

Reza Fuad

Ardyono Priyadi

Heri Suryoatmojo

Supeno Mardi

Dimas Anton

Fajar Budiman

Joko Susilo

I Made Yulistya Negara

Steering Committee

Tri Arief Sardjono (Institut Teknologi Sepuluh Nopember (ITS))

GamantyoHendrantoro (Institut Teknologi Sepuluh Nopember (ITS))

KuncoroWastuwibowo (IEEE Indonesia Section)

Kohei Arai (Saga University- Japan)

Soegijardjo Soegijoko (ITB-Indonesia, Chapter chair of IEEE EMBS and CASS society)

I Ketut Eddy Purnama (ITS, Indonesia)

Tsuyoshi Usagawa (Kumamoto University, Japan)

Ghais El Zein (IETR, France)

Sebastien Pillement (Polytechnic de Nantes, France)

Takeshi Fukusako (Kumamoto University- Japan)

Technical Program Committee

Abd. Kadir Mahamad(UTHM, Malaysia)
Achmad Affandi (ITS, Indonesia)
Achmad Arifin (ITS, Indonesia)
Achmad Basuki (PENS)
Adel A. Elbaset (Minia University, Egypt)
Adhi Darma Wibawa (ITS, Indonesia)
Adit Kurniawan (ITB, Indonesia)
Anik Handayani (UniversitasNegeri Malang)
Ardyono Priyadi (ITS, Indonesia)
Basuki Rahmad (Telkom University)
Cahya Rachmad (Polinema)
Danang Wijaya (UGM, Indonesia)
Darlis Herumurti (ITS, Indonesia)
Dimas Anton (ITS, Indonesia)
Eko Setijadi (ITS, Indonesia)
Endroyono (ITS, Indonesia)
Ardyono Priyadi (ITS, Indonesia)
I Made Yulistya Negara (ITS, Indonesia)
Engin Karatepe (Ege University, Turkey)
Fatchul Arifin (UNJ, Indonesia)
Frede Blaabjerg (Aalborg University, Denmark)
Gamantyo Hendrantoro (ITS, Indonesia)
Ghais El Zein (IETR, France)
I Ketut Eddy Purnama (ITS, Indonesia)
Istas Pratomo (ITS, Indonesia)
Jiang Jiuchun (Beijing Jiaotong University, China)
Khoirul Anwar (Japan Advance Insitute of Science and Technology, Japan)
Kohei Arai (Saga University- Japan)
Lipur Sugiyanta (UNJ)
Marwan Rosyadi (Kitami Institute of Technology, Japan)
Mochamad Ashari (ITS, Indonesia)
Muhammad Rivai (ITS, Indonesia)
Munawar Agus Riyadi (Diponegoro University, Indonesia)
Nathalie Raveu (Toulouse University, France)
Purwadi (ITS, Indonesia)
Rony Seto Wibowo, ST., MT (ITS, Indonesia)
Rosa Andre Asmara (Polinema)
Royyana Muslim Ijtihadie (ITS, Indonesia)
Sasongko Pramono Hadi (Gajah Mada University, Indonesia)
Sebastien Pillement (Polytechnic de Nantes, France)
Siti Sendari (Universitas Negeri Malang)

Soedibyo (ITS, Indonesia)
Soegijardjo Soegijoko (ITB-Indonesia)
Steven Ray (Unsrat, Indonesia)

Greetings From The General Chair

Foreword from Head of Department of Electrical Engineering

2015 ISITIA Committee

Program Session

Table of Contents

Invited Speaker

Invited Speaker #1

Rescue system with sensor network for vital sign monitoring.

Tutorial: OpenCV - How it works for detecting forest pigs –

Kohei Arai

Invited Speaker #2

Towards Integration of Electronic Health in Dermatology and in Drug Delivery Systems

Soegijardjo Soegijoko

Invited Speaker #3

Ultrasound imaging for the unusual structure: see the unseed

I Ketut Eddy Purnama

Artificial Intelligent

PAPER ID: 421

A vibratory-based method for road damage classification

1

Fergyanto E. Gunawan, Yanfi, Benfano Soewito

PAPER ID: 435

Prediction of Significant Wave Height in The Java Sea Using Artificial Neural Network

5

Illa Rizianiza, Aulia Siti Aisjah

PAPER ID: 528

Traffic Light Signal Parameters Optimization Using Particle Swarm Optimization

11

I Gede Pasek Suta Wijaya, Keiichi Uchimura, Gou Koutaki

PAPER ID: 569

Multi Behavior NPC Coordination Using Fuzzy Coordinator And Gaussian Distribution

17

Muhammad Aminul Akbar, Wida Praponco, Mochamad Hariadi, Supeno Mardi S.N

PAPER ID: 586	
Technical Data Analysis for Movement Prediction of Euro to USD Using Genetic Algorithm-Neural Network	23
<i>Ary Sespajayadi, Indrabayu, Ingrid Nurtanio</i>	
PAPER ID: 592	
An Automatic Text Summarization using Text Features and Singular Value Decomposition for Popular Articles in Indonesia Language	27
<i>Fergyanto E. Gunawan, Adrian Victor Juandi, Benfano Soewito</i>	
PAPER ID: 631	
The Perfomance of GM (1,1) and ARIMA for Forecasting of Foreign Tourists Visits to Indonesia	33
<i>Anung Kharista, Adhistya Erna Permanasari, Indriana Hidayah</i>	
PAPER ID: 634	
Performance Analysis of Naïve Bayes, PART and SMO for Classification of Page Interest in Web Usage Mining	39
<i>Saucha Diwandari, Adhistya Erna Permanasari, Indriana Hidayah</i>	
 <i>Control System and Robotics</i>	
PAPER ID: 422	
Design And Implementation Of A Submerged Capacitive Sensor In PID Controller To Regulate The Concentration Of Non-Denaturated Ethyl Alcohol	45
<i>Muhammad Rivai, Peter Chondro, Masaji Suwito, Shanq-Jang Ruan</i>	
PAPER ID: 480	
Inverse Kinematic Implementation of Four-Wheels Mecanum Drive Mobile Robot Using Stepper Motors	51
<i>Eka Maulana, M. Aziz Muslim, Veri Hendrayawan</i>	
PAPER ID: 511	
Design of Decoupling and Nonlinear PD Controller for Cruise Control of a Quadrotor	57
<i>Hanum Arrosida, Rusdhianto Effendy, Trihastuti Agustinah, Josaphat Pramudijanto</i>	
PAPER ID: 516	
INI Framework : Indonesian Language Interpreter Software for Controlling Nao Robot Movement	63
<i>Muhtadin, Eka Prasetya Herwidodo, Ahmad Zaini,</i>	
PAPER ID: 605	
Implementation of Fuzzy Logic Control in Robot Arm for Searching Location of Gas Leak	69
<i>Muhammad Rivai, Rendyansyah, Djoko Purwanto</i>	

PAPER ID: 611	
A Design of Radio-controlled Submarine Modification for River Water Quality Monitoring	75
<i>Sritrusta Sukaridhoto,, Dadet Pramadihanto, Taufiqurrahman, Muhammad Alif, Andrie Yuwono, Nobuo Funabiki</i>	

PAPER ID: 623	
2D Map Creator for Robot Navigation by Utilizing Kinect and Rotary Encoder	81
<i>Ronny Mardiyanto,Janu Anggoro,Fajar Budiman</i>	

Electronics and Biomedical Engineering

PAPER ID: 389	
Performing High Accuracy of The System for Cataract Detection Using Statistical Texture Analysis and K-Nearest Neighbor	85
<i>Yunendah Nur Fuadah,Agung W Setiawan,Tati Latifah Erawati Rajab</i>	

PAPER ID: 409	
A Comparison of Classification Methods on Diagnosis of Thyroid Diseases	89
<i>I Md. Dendi Maysanjaya, Hanung Adi Nugroho, Noor Akhmad Setiawan</i>	

PAPER ID: 427	
Wireless Body Area Network for Monitoring Body Temperature, Heart Beat and Oxygen in Blood	93
<i>M. Udin Harun Al Rasyid, Bih-Hwang Lee, Amang Sudarsono</i>	

PAPER ID: 446	
Hardware Implementation of Montgomery Modular Multiplication Algorithm Using Iterative Architecture	97
<i>Antonius P. Renardy, Nur Ahmadi, Ashbir A. Fadila, Naufal Shidqi, Trio Adiono</i>	

PAPER ID: 450	
Skeletonization Using Thinning Method for Human Motion System	101
<i>Wahyu Andhyka Kusuma, Lailatul Husniah</i>	

PAPER ID: 451	
The Effect of Photoelectrode TiO₂ Layer Thickness to The Output Power of Chlorophyll-Based Dye-Sensitized Solar Cell (DSSC)	105
<i>Sholeh Hadi Pramono, Eka Maulana, M.A.R. Sembiring</i>	

PAPER ID: 514	
FPGA Implementation of Modified Serial Montgomery Modular Multiplication for 2048-bit RSA Cryptosystems	111
<i>Bagus Hanindhito, Nur Ahmadi, Hafez Hogantara, Annisa I. Arrahmah, Trio Adiono</i>	

PAPER ID: 533	
TGS2611 Performance as Biogas Monitoring Instrument in Digester Model Application	117
<i>Helmy Rahadian, Bambang Sutopo, Indah Soesanti</i>	
PAPER ID: 563	
A Signal Processing Framework for Multimodal Cardiac Analysis	123
<i>Nada Fitriyatul Hikmah, Achmad Arifin, Tri Arief Sardjono, * Eko Agus Suprayitno</i>	
PAPER ID: 591	
Design of Wearable System for Closed-Loop Control of Gait Restoration System by Functional Electrical Stimulation	129
<i>Fauzan Arrofiqi, Achmad Arifin, Benicditus Indrajaaya</i>	
PAPER ID: 603	
Automatic Segmentation of Malaria Parasites on Thick Blood Film using Blob Analysis	135
<i>Dwi Harini Sulistyawati, Farah Zakiyah Rahmanti, I Ketut Eddy Purnama, Mauridhi Hery Purnomo</i>	
 <i>Power System</i>	
PAPER ID: 445	
Conditions of PV-Diesel Hybrid Systems In Tagalaya Village, Tagalaya Island, North Halmahera, North Maluku	141
<i>Leony Ariesta Wenno, F. Danang Wijaya</i>	
PAPER ID: 462	
Optimal Placement And Tuning Power System Stabilizer Using Participation Factor And Imperialist Competitive Algorithm In 150 Kv South Of Sulawesi System	145
<i>Muhammad Ruswandi Djalal, Andi Imran, Imam Robandi</i>	
PAPER ID: 465	
Multi Objective Optimal Power Flow To Minimize Losses and Carbon Emission Using Wolf Algorithm	151
<i>Yun Tonce Kusuma Priyanto, Lukman Hendarwin</i>	
PAPER ID: 466	
Optimal Controller for Doubly Fed Induction Generator (DFIG) Using Differential Evolutionary Algorithm (DE)	157
<i>H. Suryoatmojo, A. M. B. Zakariya, A. Musthofa, I. Robandi, S. Anam</i>	
PAPER ID: 472	
Accelerated Ageing experiment for Induction motor Insulation Due to Humidity Effect	163
<i>Dapis, Muhammad Wahyudi, Dimas Anton Asfani, Daniar Fahmi, I Made Yulistya Negara</i>	

PAPER ID: 475	
Digital Overcurrent Relay with Conventional Curve Modeling Using Levenberg-Marquardt Backpropagation	169
<i>Anang Tjahjono, Dimas Okky Anggriawan, Ardyono Priyadi, Margo Pujiantara, Mauridhi Hery Purnomo</i>	
PAPER ID: 501	
Control Design of Photovoltaic BPSX-60 Using Fuzzy Logic Controller for Low Voltage Grid	175
<i>Soedibyo, Feby Agung Pamuji, M. Ashari</i>	
PAPER ID: 509	
Combining Simplified Firefly and Modified P&O Algorithm for Maximum Power Point Tracking of Photovoltaic System Under Partial Shaded Condition	179
<i>Ardyono Priyadi, Yanuar Mahfudz Safarudin, Mauridhi Hery Purnomo, Margo Pujiantara</i>	
PAPER ID: 583	
Dynamic Optimal Power Flow with Geothermal Power Plant under Take or Pay Energy Contract	185
<i>Rony Seto Wibowo, Nani\ ' Lathifatun Nada, Sjamsjul Anam, Adi Soeprijanto, Ontoseno Penangsang</i>	
PAPER ID: 589	
Effect of Installation of Photovoltaic (PV) Generation to Power Quality in Industrial and Residential Customers Distribution Network	191
<i>Amirullah, Ontoseno Penangsang, Adi Soeprijanto</i>	
PAPER ID: 609	
Design of Bidirectional Converter Using Fuzzy Logic Controller to Optimize Battery Performance in Electric Vehicle	199
<i>Kharisma Bani Adam, Mochamad Ashari</i>	
PAPER ID: 639	
Modeling and Simulation of MPPT-Bidirectional Using Adaptive Neuro Fuzzy Inference System (ANFIS) in Distributed Energy Generation System	205
<i>Farid Dwi Murdianto, Ontoseno Penangsang, Ardyono Priyadi</i>	
 Signal and Image Processing	
PAPER ID: 403	
A New Quantitative Evaluation Metric for Color Correction Algorithm	211
<i>Mohd-Jain-Noordin Mohd Naim, Nor Ashidi Mat Isa, Wei Hong Lim</i>	
PAPER ID: 404	
SADE: Android Spectral Reflectance Estimator Application Using Wiener Estimation to Estimate Sambiloto Leaf's Age	217
<i>Muhammad Rake Linggar Anggoro, Yeni Herdiyeni</i>	

PAPER ID: 426	
A Chaos-based Fragile Watermarking Method in Spatial Domain for Image Authentication	225
<i>Rinaldi Munir</i>	
PAPER ID: 443	
3D Coordinate Extraction from Single 2D Indoor Image	231
<i>Maulana Aziz Assuja, Iping Supriana Suwardi</i>	
PAPER ID: 471	
Digital Camera Interface Mapping With Speech And Hand Gestures For Differently Abled	237
<i>Arun Kumar, Anurag Pandey</i>	
PAPER ID: 473	
Gaussian Mixture Models Optimization For Counting The Numbers Of Vehicle By Adjusting The Region Of Interest Under Heavy Traffic Condition	243
<i>Basri, Indrabayu, Andani Achmad</i>	
PAPER ID: 479	
Multimedia Adventure Game Folklore "Doyan Nada" For Improving The Cultural Understanding of Sasak (Lombok) to Children	249
<i>Yana Hendriana, Renna Yanwastika Ariyana</i>	
PAPER ID: 488	
Remodeling of Human Foot Using Chain Code For Designing Special Shoes	255
<i>Cahyo Dwi Raharjo, Izzati Muhimmah</i>	
PAPER ID: 517	
Six Key Points Lip's Feature Extraction Using Adaptive Threshold Segmentation	259
<i>Hadid Tunas Bangsawan, Ronny Mardiyanto, Tri Arief Sardjono</i>	
PAPER ID: 600	
Scattering on Mini Underwater Acoustic Tank	265
<i>Rindy Trisna Wulandari, Dhany Arifianto</i>	
PAPER ID: 633	
Synthesis of Virtual Character Poses Using Lagrange Polynomial Interpolation	271
<i>Irwan Karim\', Surya Sumpeno, Mauridhi Hery Purnomo</i>	
PAPER ID: 636	
Music Transcription of Javanese Gamelan Using Short Time Fourier Transform (STFT)	277
<i>Liza Fitria, Yoyon Kusnendar Suprpto, Mauridhi Hery Purnomo</i>	
PAPER ID: 640	
Separation of Gamelan Instruments Signal Using ICA Based on Projection Pursuit	283
<i>Atik Wintarti, Yoyon K. Suprpto</i>	

Information System and Computer Science

PAPER ID: 383	
Formal Verification of Integrated Modular Avionics (IMA) Health Monitoring using Timed Automata	289
<i>Ida Bagus Budiyo, Achmad Imam Kistijantoro, Bambang Riyanto Trilaksono</i>	
PAPER ID: 392	
Design of Agent Framework Using Aspect Oriented Approach	295
<i>Maman Somantri, Lukito Edi Nugroho, Widyawan, Ahmad Ashari</i>	
PAPER ID: 401	
Data Transmission Strategy of Probe Vehicle in Floating Car Traffic Monitoring	301
<i>Fergyanto E. Gunawan, Fajar Yoseph Chandra, Benfano Soewito</i>	
PAPER ID: 424	
Workflow Common Fragments Extraction Based on WSDL Similarity and Graph Dependency	307
<i>Riyanarto Sarno, Endang, Dwi Sunaryono, Sarwosri</i>	
PAPER ID: 425	
Business Process Composition Based on Meta Models	313
<i>Riyanarto Sarno, Endang, Dwi Sunaryono, Sarwosri</i>	
PAPER ID: 428	
Application Search School Location Method Using Location Based Services (LBS) based on J2ME	317
<i>Wasum, Andreas Setiyono, Raimundus Sedo, Sholeh Hadi Pramono</i>	
PAPER ID: 454	
EVALUATION MATURITY INDEX AND RISK MANAGEMENT FOR IT GOVERNANCE USING FUZZY AHP AND FUZZY TOPSIS (CASE STUDY BANK XYZ)	321
<i>Uky Yudatama, Riyanarto Sarno</i>	
PAPER ID: 457	
Handling Of Internal Inconsistency OLAP - Based Lock Table Using Message Oriented Middleware In Near Real Time Data Warehousing	327
<i>Ardianto Wibowo, Saiful Akbar</i>	
PAPER ID: 474	
Development of Algorithmic-Based Estimation for Cost Estimation of In-House Software in Government Agencies. Case Study: Badan Pusat Statistik	333
<i>Joko Widiarto, Arry Akhmad Arman</i>	
PAPER ID: 491	
Evaluation of Edutainment e-Marketing Model Implementation at Bank Mandiri Museum	339
<i>Arta Moro Sundjaja, Evi Ekawati</i>	

PAPER ID: 500	
Problems and Available Solutions On The Stage of Extract, Transform, and Loading In Near Real-Time Data Warehousing (A Literature Study)	343
<i>Ardianto Wibowo</i>	
PAPER ID: 614	
NAIVE RANDOM NEIGHBOR SELECTION FOR MEMORY BASED COLLABORATIVE FILTERING	349
<i>Agung Toto Wibowo, Aulia Rahmawati</i>	
PAPER ID: 619	
Implementation of Modified Probabilistic Caching Schema On Bittorrent Protocol for Video on Demand Content	355
<i>Mahar Faiqurahman, Achmad Imam Kistijantoro</i>	
PAPER ID: 626	
Usability Characteristic Evaluation On Administration Module of Academic Information System Using ISO/IEC 9126 Quality Model	361
<i>Siti Rochimah, Hanifa I Rahmani, Umi Laili Yuhana</i>	
PAPER ID: 635	
Genetic Algorithm in Solving the TSP on These Mineral Water Distribution	367
<i>Richki Hardi</i>	
PAPER ID: 637	
Noun Ontology Generation From Wikipedia Article Using Map Reduce with Pattern Based Approach	371
<i>Joan Santoso, James Nakoda Nugraha, Eko Mulyanto Yuniarno, Mochamad Hariadi</i>	
 <i>Telecommunication System and Networking</i>	
PAPER ID: 386	
Energy Efficiency in Cognitive Radio with Cooperative MME (Maximum to Minimum Eigenvalue) Spectrum Sensing Method	377
<i>Syarifah Muthia Putri, Sugihortono</i>	
PAPER ID: 434	
Design And Implementation Fast Response System Monitoring Server Using Simple Network Management Protocol (SNMP)	383
<i>Achmad Affandi, Dhany Riyanto, Istas Pratomo, Gatot Kusrahardjo</i>	
PAPER ID: 436	
Opnvoice : Low-Cost Mobile Wireless Communication Project For Rural Area Based On OpenWRT	389
<i>Asriadi, Istas Pratomo, Achmad Affandi, Djoko Suprajitno Rahardjo</i>	

PAPER ID: 453	
Prototype Development of Monitoring System in Patient Infusion with Wireless Sensor Network	395
<i>Fathur Zaini Rachman</i>	
PAPER ID: 503	
Balanced-Delay Filterbank for Closed-Loop Spatial Audio Coding	401
<i>Ikhwana Elfritri, Heru Dibyo Laksono, Al Kautsar Permana</i>	
PAPER ID: 529	
16-Port Array Antenna Feeding Network with Programmable Phase Shifter Capability	407
<i>Jane Litouw, Achmad Munir</i>	
PAPER ID: 556	
Design of Microstrip Patch Antenna Based on Complementary Split Ring Resonator Metamaterial for WiMAX Applications	411
<i>Nurul Khaerani Hamzidah, Eko Setijadi</i>	
PAPER ID: 557	
Design and Simulation Wimax Networks 802.16d and 802.16e In Sleman	417
<i>Firdaus, Isra Darmawan, Hendra Setiawan, Ferdyan Pradana</i>	
PAPER ID: 562	
Pathloss and Shadowing Characteristics in Indoor Environment at 2.4 Ghz Band	421
<i>Puji Handayani, Lina Mubarakah, Gamantyo Hendrantoro</i>	
PAPER ID: 566	
Early Results from Adaptive Combination of LRU, LFU and FIFO to Improve Cache Server Performance in Telecommunication Network	427
<i>Tanwir, Gamantyo Hendrantoro, Achmad Affandi</i>	
PAPER ID: 585	
Scattering Parameters Extraction of Dielectric Loaded Circular Waveguide Using Cylindrical Coordinate System-based FDTD Method	431
<i>Ershad Junus Amin, Achmad Munir</i>	
PAPER ID: 587	
Performance Analysis of Cooperative Spectrum Sensing with Asymmetric Channel	435
<i>Abdul Haris Junus Ontowirjo, Wirawan, Adi Soeprijanto</i>	
PAPER ID: 607	
Printed Traveling Wave Antenna\Composed of Interdigital Capacitor Structure for Wireless Communication Application	439
<i>Achmad Munir, Eka Kurnia Sari</i>	
PAPER ID: 617	
Comparative Analysis of Routing Protocol on Wireless Sensor Network (WSN) with Gradient Based Approach and Geographic Based Approach Method	443
<i>Miftahul Khairat Sukma, Indarini Dyah Irawati, Hafidudin</i>	

PAPER ID: 625

**Implementation and Performance Evaluation of Orthogonal Frequency Division
Multiplexing (OFDM) using WARP** 449
